

ABSTRACT

PATIENT HEALTH TRACKER

This project involves the development of an web application for viewing and managing patient data. The website is designed to help doctors to see the medical history of their patients. Doctors can also continually upgrade the system by entering the latest medical data of their patients. This website can be accessed on any device. Doctors can login using the website from their devices and enter relevant information about their patients, including patient name, disease history, medication administered, date of arrival, and consultation and treatment costs, among other things. Once the information is saved in the system, it will be stored for the perusal of doctors in their future cases.

So, if a patient comes for a follow-up routine, doctors can immediately check up on their medical history and provide the necessary medical treatments.
